Chapter 1 Introduction

This document outlines the feature set and use of the DNx-AO-308-353, an 8-channel, high voltage, analog output board.

The following sections are provided in this chapter:

- Organization of Manual (Section 1.1)
- AO-308-353 Board Overview (Section 1.2)
- Specification (Section 1.3)
- Device Architecture (Section 1.4)
- Indicators (Section 1.5)
- Wiring and Connections (pinout) (Section 1.6)

1.1 Organization of Manual

This AO-308-353 User Manual is organized as follows:

- **Introduction**
Chapter 1 provides an overview of DNx-AO-308-353 Analog Output Board features, device architecture, connectivity, and logic.
- **Programming with the High-Level API**
Chapter 2 provides an overview of the how to create a session, configure the session, and generate output on the DNx-AO-308-353 with the UEIDAQ High-level Framework API.
- **Programming with the Low-Level API**
Chapter 3 is an overview of low-level API commands for configuring and using the DNx-AO-308-353.
- **Appendix A - Accessories**
This appendix provides a list of accessories available for use with the DNx-AO-308-353 board.

NOTE: A glossary of terms used with the PowerDNA Cube/Rack and layers can be viewed and/or downloaded from www.ueidaq.com.

Manual Conventions

To help you get the most out of this manual and our products, please note that we use the following conventions:

Tips are designed to highlight quick ways to get the job done or to reveal good ideas you might not discover on your own.

NOTE: Notes alert you to important information.

CAUTION! Caution advises you of precautions to take to avoid injury, data loss, and damage to your boards or a system crash.

Text formatted in **bold** typeface generally represents text that should be entered verbatim. For instance, it can represent a command, as in the following example: “You can instruct users how to run setup using a command such as **setup.exe**.”

Bold typeface will also represent field or button names, as in “Click **Scan Network**.”

Text formatted in *fixed* typeface generally represents source code or other text that should be entered verbatim into the source code, initialization, or other file.

Examples of Manual Conventions

Before plugging any I/O connector into the Cube or RACKtangle, be sure to remove power from all field wiring. Failure to do so may cause severe damage to the equipment.

Usage of Terms

Throughout this manual, the term “Cube” refers to either a PowerDNA Cube product or to a PowerDNR RACKtangle™ rack mounted system, whichever is applicable. The term DNR is a specific reference to the RACKtangle, DNA to the PowerDNA I/O Cube, and DNx to refer to both.

1.2 AO-308-353 Board Overview

The AO-308-353 is part of the AO-308 series of Analog Output boards:

- AO-308 16-bit, 8 channel, ± 10 V Analog Output Board
- AO-308-350 16-bit, 8 channel, ± 10 V, High Current Analog Output Board
- AO-308-352 16-bit, 8 channel, ± 13.5 V, Medium Voltage/Current Analog Output Board
- AO-308-353 16-bit, 8 channel, ± 40 V, High Voltage Analog Output Board
- AO-308-020 16-bit, 8 channel, 0-20 mA, Current Analog Output Board
- AO-308-420 16-bit, 8 channel, 4-20 mA, Current Analog Output Board

This manual describes the AO-308-353 High Voltage, 16-bit, 8-channel, ± 40 V Analog Output board only. The other products in the series are described in separate documents.

The DNA-AO-308-353, DNR-AO-308-353, and DNF-AO-308-353 boards are compatible with the UEI Cube, RACKtangle, and FLATRACK chassis respectively. These board versions are electrically identical and only differ in mounting hardware. The DNA version is designed to stack in a cube chassis. The DNR/F versions are designed to plug into the backplane of a RACK chassis. For brevity we will refer to all form factors of the board simply as the AO-308-353 throughout the rest of the manual.

Using an AO-308-353 instead of an AO-308 boosts voltage capability to ± 40 V per channel. It uses a ± 45 V source, supplied from an external supply or internally by the addition of a DNA-PC-913 Power Conversion board mounted in the UEI chassis.

1.3 Specification The technical specifications for the AO-308-353 High Voltage Analog Output board are listed in **Table 1-1**.

Table 1-1 DNx-AO-308-353 Technical Specifications

Number of Channels	8
Resolution	16 bits
Max Update Rate: @ 16-bit resolution	100 kHz/chan (500kHz max aggregate)
Buffer Size	1K samples
Type of D/A	double-buffered
INL (no load)	±1 LSB (0.003%)
DNL (no load)	±1 LSB (0.003%)
Monotonicity Over Temperature	16 bits
Gain Linearity Error	0.002%
Gain Calibration Error	±1 mV
Offset Calibration Error	±1 mV
Offset Drift	5ppm/°C
Gain Drift	5ppm/°C
Output Range	±40V
Output Coupling	DC
Output Impedance	0.1Ω max
Current Drive	±5mA/channel
Capacitive Loads	500 pF
Settling Time	10 μs to 16 bits
Slew Rate	10 V/μs
Isolation	350Vrms
Power Consumption ²	1.8W - 5W
Physical Dimensions	3.875" x 3.875" (98 x 98 mm)
Operating Temp. (tested)	-40°C to +85°C
Operating Humidity	0 -95%, non-condensing
Vibration <i>IEC 60068-2-6</i> <i>IEC 60068-2-64</i>	5 g, 10-500 Hz, sinusoidal 5 g (rms), 10-500Hz, broadband random
Shock <i>IEC 60068-2-27</i>	100 g, 3 ms half sine, 18 shocks @ 6 orientations 30 g, 11 ms half sine, 18 shocks @ 6 orientations
Altitude	120,000 ft
MTBF	480,000 hours

¹ If the total power consumption of the board is over 4.5W, a DNA-FANx rear-mount cooling fan is required. Refer to the Typical Performance Characteristics for more detail.

1.4 Device Architecture

The AO-308-353 High Voltage Analog Output board has eight individual analog output channels. A simplified block diagram of the board is shown in **Figure 1-1**.

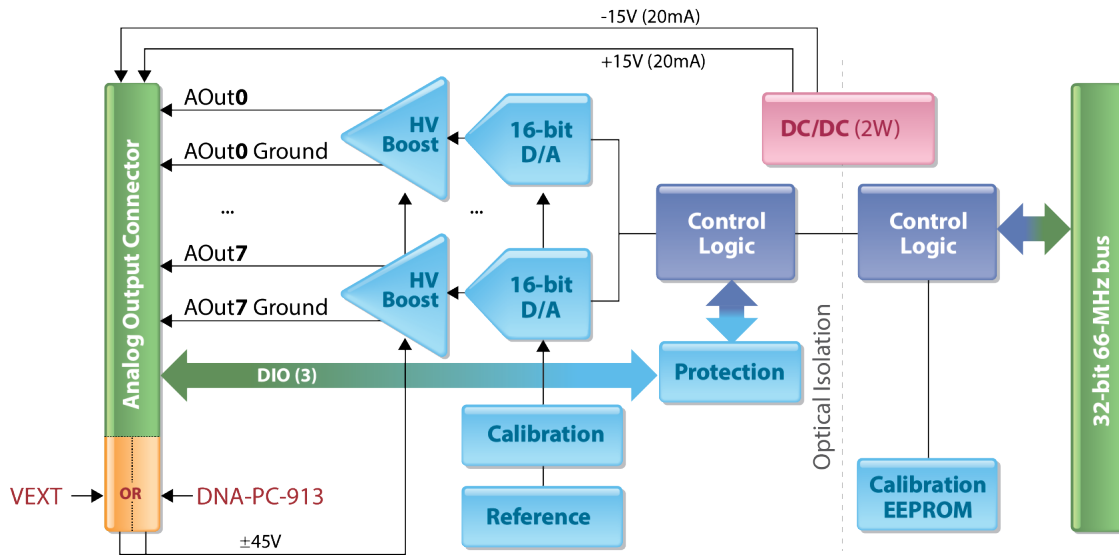

Figure 1-1. Block Diagram of the AO-308-353 Layer

1.5 Indicators

A photo of the AO-308-353 board is shown in **Figure 1-2**.

The front panel has two LED indicators:

- RDY: indicates that the layer is receiving power and operational.
- STS: can be set by the user using the low-level framework.

Figure 1-2. Photo of DNA-AO-308-353 Layer

1.6 Wiring and Connections (pinout)

The pinout of the 37-pin connector for the AO-308-353 board is shown in **Figure 1-3**. A diagram for using the PC-913 for supplying external power to the AO-308-353 is shown in **Figure 1-4**.

**DB-37 (female)
 37-pin connector:**

AOUT0 GND	37	19	AGND
AGND	36	18	AOUT0
AOUT1	35	17	AOUT1 GND
AOUT2 GND	34	16	AGND
AGND	33	15	AOUT2
AOUT3	32	14	AOUT3 GND
AOUT4 GND	31	13	AGND
AGND	30	12	AOUT4
AOUT5	29	11	AOUT5 GND
AOUT6 GND	28	10	AGND
AGND	27	9	AOUT6
AOUT7	26	8	AOUT7 GND
+VEXT (140mA fused)	25	7	AGND
AGND	24	6	-VEXT (140mA fused)
AGND	23	5	AGND
DIO2	22	4	DIO1
AGND	21	3	DIO0
-15V (20mA) OUT	20	2	+15V (20mA) OUT
		1	AGND

Note: If powering externally, connect $\pm 45V$ power supply to pins **+VEXT** (25) and **-VEXT** (6).

Figure 1-3. Pinout of the AO-308-353

Since the AO-308-353 High Voltage Analog Output board is designed with output buffers, separate sense lines are not provided. To minimize error due to differences in lead resistance, be sure to use equal length signal and return lines.

- 1.6.1 Interconnecting a DNx-AO-308-353 and a DNx-PC-913** Using an AO-308-353 with a DNx-PC-913 as the $\pm 45V$ external power supply requires interconnections between the two boards as shown in **Figure 1-4** below.

Interconnection Between DNx-PC-913 and DNx-AO-308-353

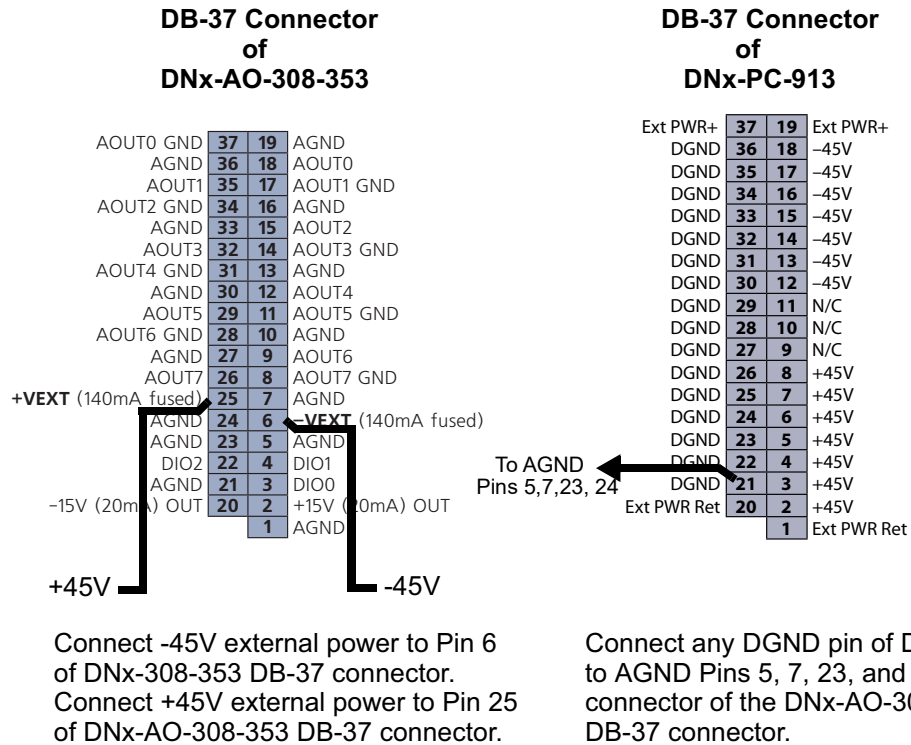

Figure 1-4. DNx-PC-913 and AO-308-353 Interconnection Diagram

Chapter 2 Programming with the High-Level API

This chapter provides the following information about using the UeiDaq high-level Framework API to program the DNx-AO-308-353:

- About the High-level Framework (Section 2.1)
- Creating a Session (Section 2.2)
- Configuring the Resource String (Section 2.3)
- Configuring Channels for Output (Section 2.4)
- Configuring the Timing (Section 2.5)
- Writing Data (Section 2.6)
- Cleaning-up the Session (Section 2.7)

2.1 About the High-level Framework

UeiDaq Framework is object oriented and its objects can be manipulated in the same manner from different development environments, such as Visual C++, Visual Basic, or LabVIEW.

UeiDaq Framework is bundled with examples for supported programming languages. Examples are located under the UEI programs group in:

- *Start » Programs » UEI » Framework » Examples*

The following sections focus on the C++ API, but the concept is the same no matter which programming language you use.

Please refer to the “UeiDaq Framework User Manual” for more information on use of other programming languages.

2.2 Creating a Session

The Session object controls all operations on your PowerDNx device. Therefore, the first task is to create a session object:

```
// create a session object for input
CUEISession session;
```

2.3 Configuring the Resource String

UeiDaq Framework uses resource strings to select which device, subsystem and channels to use within a session. The resource string syntax is similar to a web URL:

```
<device class>://<IP address>/<Device Id>/<Subsystem><Channel list>
```

For PowerDNA and RACKtangle, the device class is **pdna**.

For example, the following resource string selects analog output lines 0,1,2,3 on device 1 at IP address 192.168.100.2: “pdna://192.168.100.2/Dev1/Ao0:3” as a range, or as a list “pdna://192.168.100.2/Dev1/Ao0,1,2,3”.

2.4 Configuring Channels for Output The AO-308-353 can be configured for analog output:

```
// Configure channels 0,1 with an output range of ±40V
session.CreateAOChannel("pdna://192.168.100.2/Dev0/ao0:1",
                        -40.0, 40.0);
```

2.5 Configuring the Timing You can configure the AO-308-353 series boards to run either in simple mode (point by point) or buffered mode (ACB mode).

In simple mode, the delay between samples is determined by software on the host computer.

In buffered mode, the delay between samples is determined by the AO-308-353 on-board clock.

The following sample shows how to configure the simple mode. Please refer to the “UeiDaq Framework User Manual” to learn how to use the other timing modes.

```
// configure timing of input for point-by-point (simple mode)
session.ConfigureTimingForSimpleIO();
```

2.6 Writing Data Writing data to the AO-308-353 board is done with a writer object. You can create a writer object that writes raw data straight to the D/A converter. You can also create a writer object that writes data scaled to volts. Framework automatically performs a conversion to binary code before sending the data to the D/A converter.

The following sample code shows how to create a scaled writer object and write a sample.

```
// create a writer and link it to the session's stream
CueiAnalogScaledWriter writer(session.GetDataStream());
// the buffer must be big enough to contain one value per channel
double data[2] = {0.0, 0.0};
// write one scan, where the buffer will contain one value per channel
writer.WriteSingleScan(data);
```

Or you can create a writer object that writes raw data straight to the DAC.

```
// create a writer and link it to the session's stream
CueiAnalogRawWriter writer(session.GetDataStream());
// the buffer must be big enough to contain one value per channel
```

```
// create a writer and link it to the session's stream
uint16 data[2] = {0x1234, 0x5678};

// write one scan, where the buffer will contain one value per channel
writer.WriteSingleScan(data);
```

All the AO-308-xxx analog output layers are programmed the same way.

2.7 Cleaning-up the Session

The session object will clean itself up when it goes out of scope or when it is destroyed. To reuse the object with a different set of channels or parameters, you can manually clean up the session as follows:

```
// clean up the session
session.CleanUp();
```

Chapter 3 Programming with the Low-Level API

This chapter provides the following information about programming the DNx-AO-308-353 Analog Output Board using the low-level API. All AO-308-xxx layers are programmed the same way.

- About the Low-level API (Section 3.1)
- Low-level Functions (Section 3.2)
- Low-level Programming Techniques (Section 3.3)
- Data Output Modes (Section 3.4)
- Programming the AO-308-xxx (Immediate Mode) (Section 3.5)
- Configuration Settings (Section 3.6)
- Data Representation (Section 3.7)

3.1 About the Low-level API

The low-level API provides direct access to the DAQBIOS protocol structure and registers in C. The low-level API is intended for speed-optimization, when programming unconventional functionality, or when programming under Linux or real-time operating systems.

When programming in Windows OS, however, we recommend that you use the UeiDaq high-level Framework API (see **Chapter 2**). The Framework extends the low-level API with additional functionality that makes programming easier and faster.

For additional information regarding low-level programming, refer to the “PowerDNA API Reference Manual” located in the following directories:

- On Linux systems:
`<PowerDNA-x.y.z>/docs`
- On Windows systems:
`C:\Program Files (x86)\UEI\PowerDNA\Documentation`

3.2 Low-level Functions

Table 3-1 provides a summary of AO-308-xxx specific functions. All low-level functions are described in detail in the PowerDNA API Reference Manual.

Table 3-1 Summary of Low-level API Functions for DNx-AO-308-xxx

Function	Description
DqAdv3xxWrite	Write either floating point or raw values to AO-308-xxx output.
DqAdv3xxSetWForm	Set configuration for continuous waveform output.
DqAdv3xxWriteWFormCL	Loads repetitive waveform into the analog output layer memory.
DqAdv3xxEnableWForm	Configures, enables, pause/resumes, or disables waveform output.

3.3 Low-level Programming Techniques

Application developers are encouraged to explore the existing source code examples when first programming the AO-308-xxx. Sample code provided with the installation is self-documented and serves as a good starting point.

Code examples are located in the following directories:

- On Linux systems: *<PowerDNA-x.y.z>/src/DAQLib_Samples*
- On Windows: *C:\Program Files (x86)\UEI\PowerDNA\SDK\Examples*

Sample code for data acquisition modes have the name of the mode and the name of the I/O boards being programmed embedded in the sample name. For example, *SampleVMap3xx* contains sample code for running the an AO-308-xxx using VMap data acquisition mode. Note that immediate mode samples are named *Sample<I/O board name>*, (i.e., *Sample30x*).

3.4 Data Output Modes

The AO-308-xxx I/O board can be programmed using the following modes. You can only use one mode at a time and cannot, for example, run one channel in immediate mode and the other in waveform mode. API that implement data acquisition modes and additional mode descriptions are provided in the *PowerDNA API Reference Manual*.

3.4.1 Immediate (Point-by-Point) Mode

This is the easiest way to program the AO-308-xxx but also the least efficient. Immediate mode writes a single data point per channel to the layer at a non-deterministic pace. The maximum point-by-point rate is 100 Hz. Use the API `DqAdv3xxWrite()` to update the AO-308-xxx outputs with a DC voltage. The outputs will update on the next clock tick. When `DqAdv3xxWrite()` is called for the first time, the firmware terminates any ongoing operation on the device. Then, the firmware parses the channel list and writes the passed values one by one. This function cannot be called when the layer is involved in any streaming or data mapping operations. Every write to the channel takes approximately 3.3 μ s. Thus, execution time for this function depends on the number of channels in the channel list. AO-308-xxx runs its outputs at 1 kHz by default and you can change the update rate with `DqCmdSetClock()`. The example code `Sample30x` demonstrates immediate mode on AO-308-xxx.

3.4.2 Waveform Re-generation

This mode continuously generates a waveform uploaded in the AO-308-xxx's FIFO. The example code `Sample3xx_Waveform` demonstrates this mode.

3.4.3 DMAP Mode

Data Map (DMAP) mode is recommended to efficiently read and update one value per channel at a time. DMap is designed for closed-loop (control) applications and may include channels across multiple I/O layers. It guarantees that all I/O layers configured in the same DMAP are synchronized (all input samples are read at the same time and all output values are updated at the same time). The example code `SampleRTDMap3xx` demonstrates RTDMAP mode.

3.4.4 VMAP Mode

Variable Data Map (VMAP) mode reads and updates a variable number of data points per channel at a time. VMap is designed for closed-loop (control) applications and may include channels across multiple I/O layers. It guarantees that all I/O layers configured in the same VMAP are synchronized (all input samples are read at the same time and all output values are updated at the same time). The example code `SampleVMap3xx` demonstrates VMAP mode.

3.4.5 ACB Mode

Advanced Circular Buffer (ACB) mode continuously uploads and generates an arbitrary waveform to the AO-308-xxx outputs. It uses an event based software architecture to notify the user's when it's time to upload a new block of data. This is the only mode that can update the AO-308-xxx outputs at maximum speed. Not available on UEIPAC products. The example code `SampleACB30x` demonstrates ACB mode.

3.5 Programming the AO-308-xxx (Immediate Mode) The following sections provide an overview of how to set up and use your AO-308-xxx in Immediate Mode using the low-level API. For best results, use this overview in conjunction with actual sample code, (i.e., Sample30x). This overview does not address typical initialization or error handling. Refer to Section 3.3 for sample code location.

3.5.1 Setting up Channel Configuration Users initialize a list of AO-308-xxx channels to enable and output samples to. You can enable channels sequentially or in whichever order you choose

```
// CHANNELS is a max of 8.
uint32 cl[CHANNELS];

// Order channels sequentially in the channel list.
for (i = 0; i < CHANNELS; i++){
    cl[i] = i;
}
```

3.5.2 Writing Output Data In Immediate mode, use the `DqAdv3xxWrite()` API to write raw or floating point samples to each of the enabled channels (in the order of the channel list):

```
uint16 data[CHANNELS];
double fdata[CHANNELS];

// Set up and write output data.

while(!stop){
    for (i=0; i<CHANNELS; i++){
        data[i]=0; // Value isn't used, not sending raw data
        fdata[i]=nextSampleToOutput(); // see specification for output range
        DqAdv3xxWrite(hd, DEVN, CHANNELS, cl, 0, data, fdata);

        UeiPalSleep(500); // Controls data output rate
    }
}
```

3.6 Configuration Settings

Configuration settings are passed in `DqCmdSetCfg()` and `DqAcbInitOps()` functions.

Not all configuration bits apply to AO-308-xxx series layers. Some important definitions:

- `DQ_LN_ENABLE` enables all operations with the layer.
- `DQ_LN_CVCKSRC0` selects the internal channel list clock (CL) source as a timebase. AO-308 supports CV clock.
- `DQ_LN_ACTIVE` is needed to switch on “STS” LED on the CPU layer.

For example, for streaming operations with hardware clocking you can select the following flags:

```
DQ_LN_ENABLE | DQ_LN_CVCKSRC0 | DQ_LN_STREAMING |
DQ_LN_IRQEN | DQ_LN_ACTIVE
```

The AO-308-xxx also has a range of layer-specific settings, as follows:

```
// continuous output with FIFO. Mode reserved for future use.
#define DQ_AO3xx_MODEFIFO (1L << 19)
// waveform mode - continuous. Mode reserved for future use.
#define DQ_AO3xx_MODECONT (2L << 19)
// waveform mode - regenerate. Mode reserved for future use.
#define DQ_AO3xx_MODECYCLE (3L << 19)
// waveform mode - hardware. Mode reserved for future use.
#define DQ_AO3xx_MODEWFGEN (4L << 19)
```

You can select either the CL or CV clock as a timebase. Because of the parallel architecture of the AO-308-xxx layer, either clock triggers all converters.

Aggregate rate = Per-channel rate * Number of channels

Note that acquisition rate cannot be selected on per-channel basis.

3.7 Data Representation

AO-308-xxx has a 16-bit straight binary data representation:

Layer	Range/ Value	0x0	0x8000	0xFFFF	Span	Offset
AO-308, -350	±10V	-10V	0	+10V	20V	0
-352	±13.5V	-13.5V	0	+13.5V	27V	0
-353	±40V	-40V	0	+40V	80V	0
-020	0-20mA	0mA	10mA	20mA	20mA	0
-420	4-20mA	4mA	12mA	20mA	16mA	4mA

To convert voltage into an A/D representation, use the following formula:

$$Raw = (Volt + Offset) / (Span / 0xFFFF),$$

where Volt is the desired level in volts.

To convert current into A/D representation, use the following formula:

$$Raw = (mA + Offset) / (Span / 0xFFFF),$$

where mA is the desired level in milliamps.

Appendix A

A. Accessories

The following cables and STP boards are available for the AO-308-353 layer.

DNA-CBL-37

This is a 37-conductor flat ribbon cable with 37-pin male D-sub connectors on both ends. The length is 3ft and the weight is 3.4 ounces or 98 grams.

DNA-CBL-37S

This is a 37-conductor round shielded cable with 37-pin male D-sub connectors on both ends. It is made with round, heavy-shielded cable; 3 ft (90 cm) long, weight of 10 ounces or 282 grams; also available in 10ft and 20ft lengths.

DNA-STP-37

The DNA-STP-37 provides easy screw terminal connections for all DNx series I/O boards which utilize the 37-pin connector scheme. The DNA-STP-37 is connected to the I/O board via either DNA-CBL-37 or DNA-CBL-37S cable. The dimensions of the STP-37 board are 4.2w x 2.8d x 1.0h inch or 10.6 x 7.1 x 7.6 cm (with standoffs). The weight of the STP-37 board is 2.4 ounces or 69 grams.

Figure A-1. Pinout and photo of DNA-STP-37 screw terminal panel

UEI-STP-AO-200

The UEI-STP-AO-200 is a unity gain, high current output buffer board for use with DNA-AO-308 and PD2/PDXI series analog output boards. It offers a gain of $1 \pm 0.2\%$ and drives up to 250 mA at ± 10 Volts. It requires a user-supplied ± 13 to ± 15 V power supply with current capability to support the output current specified. Users who do not want to supply bipolar power should order the UEI-STP-AO-200D unit, which includes a DC/DC converter and requires a +9V to +36V power supply.

If the total power consumption of the layer exceeds 4.5W, a rear mount cooling fan such as the DNA-FAN5 (for 3-layer Cube) or DNA-FAN8 (for 5-layer Cube) should be added to the DNA Cube.
